Complementary capabilities for table question answering

A system can combine representation learning, context selection, generation and program execution.

Structure representations

Encode row / column relations and table-text associations. Known structure is assumed.

OmniTab; FORTAP; ReasTAP
AIT-QA; FeTaQA (benchmarks)

Generation and selection

Tune, decompose or select question-relevant table context. May omit relevant cells.

Table-GPT; TableGPT2; CABINET
Chain-of-Table; TabSQLify

Execution and feedback

Use SQL, code or tool feedback to evaluate an explicit plan. Valid code can use wrong data.

OpenTab; Weaver; TaPERA
Plan-of-SQLs reasoning

Report answer correctness, evidence grounding and execution validity separately; none implies the others.
